PROJECT REPORT

Customer Feedback Automation Using n8n

Submitted by: Noorwali Khan
Platform: n8n Cloud
Date: 06 November 2026

1. Project Overview

The Customer Feedback Automation system is designed to collect customer feedback through an online form, automatically store responses in Google Sheets, and send email alerts when a customer submits a low rating.

The workflow reduces manual work and helps businesses identify customer dissatisfaction quickly.

2. Tools and Technologies Used

- n8n Cloud: Workflow automation platform.
- n8n Form Trigger: Collects customer feedback through an online form.
- Google Sheets: Stores customer feedback automatically.
- IF Node: Checks customer ratings against a defined condition.
- Gmail: Sends automatic email notifications for low ratings.

3. Workflow Implementation

The automation consists of four main stages:

Stage 1: Customer Feedback Form

An online form was created to collect the following information:

- Customer Name
- Customer Email
- Rating (1–5)

- Feedback Message

Stage 2: Google Sheets Integration

After form submission, customer information is automatically added as a new row in the Google Sheet named Customer Feedback Responses.

Stage 3: Rating Validation

An IF node checks the submitted rating using the following condition:

Rating ≤ 2

- True: The rating is 1 or 2, indicating low customer satisfaction.
- False: The rating is 3, 4, or 5.

Stage 4: Email Notification

If the rating is 1 or 2, the workflow automatically sends an email notification through Gmail containing:

- Customer Name
- Customer Email
- Customer Rating
- Feedback Message

For ratings of 3, 4, or 5, no alert email is sent.

4. Workflow Architecture

Workflow sequence:

Customer Feedback Form → Google Sheets → IF Condition

- True Branch: Gmail Alert
- False Branch: No Email Notification

5. Testing and Results

The workflow was tested with different customer ratings to verify its functionality.

Test Case	Customer Rating	Google Sheets	Email Alert
Test 1	1	Saved	Sent
Test 2	5	Saved	Not sent
Test 3	1	Saved	Sent

Testing Results:

- Customer form submissions were received successfully.
- Customer records were automatically saved in Google Sheets.
- The IF node correctly identified low ratings.
- Gmail notifications were successfully received for low ratings.
- High ratings did not trigger unnecessary email notifications.

6. Project Outcome

The project successfully demonstrates an automated customer feedback management system.

It eliminates manual data entry, organizes customer responses, and provides immediate email notifications for negative feedback. This allows businesses to identify customer concerns and respond more efficiently.

7. Conclusion

The Customer Feedback Automation project was successfully implemented using n8n Cloud, Google Sheets, and Gmail.

The workflow demonstrates practical knowledge of workflow automation, form integration, data handling, conditional logic, and email notification systems.
